Resumo. Let F be a field of characteristic zero, L be a Lie algebra over F , and A be an L -algebra - that is, an associative algebra over F with an L -action by derivations. This action extends naturally to the universal enveloping algebra $U(L)$ of L , giving rise to the notion of differential identities (or L -identities) of A : non-commutative polynomials in variables of the form $x^u := u(x)$, where $u \in U(L)$, that vanish under all substitutions from A .

In this talk, I will present recent results on the differential identities of L -algebras, with a focus on their classification and growth behavior.
